The solubilities of solid krypton and xenon in liquid  
oxygen have been determined for the temperature range  
of 70° to 90°K. The saturation points were obtained  
from vapor pressure measurements. It was found that  
the actual solubilities were smaller than the solubilities  
calculated from the heats of fusion of the rare gases  
assuming ideal behavior of the systems. For this  
reason, the heats of solution of the rare gases in O<sub>2</sub>
